Roadmap Labs

Custom report · Example

Your AI roadmap

Your business mapped, the automations that suit you, and what each one saves over 12 months, with the working shown.

This is an example report. The business and every figure in it are illustrative, to show what you receive after your free session.

Prepared for
Example Co, a 14-person trade supplier

Prepared by
Dan Kovac, Roadmap Labs

Delivered
Within 48 hours of your session

Five automations, about $33,000 in year one, and what that figure leaves out

Most savings figures come from one line of maths: how long a task takes, times how often you do it, times what your people cost. This report shows that sum, then takes off everything it skips.

THE SIMPLE SUM SAYS

~~$54,600~~

17.5 hours a week × $65 × 48 weeks, as if every task went to zero

WHAT WE EXPECT IN YEAR ONE

$33,160

after checking time, your team's build time and running costs

STILL TO COME OFF

Build price

quoted once the scope is agreed, before any work starts

What you told us

- Quotes go out, then nobody has time to follow them up.
- The CRM, the inbox and the accounts system don't talk to each other.
- Some of the team use AI every day and some don't use it at all.

What we recommend

- Measure first. Four weeks of real numbers on quotes before we build.
- Keep the systems you have, and start with quote follow-ups.
- Build one at a time, and train the team on each before the next.

HOW SURE ARE WE?

The hours in this report are estimates from our session, not measurements. Until the reporting on page 6 is in place, treat every figure as our best estimate. The saving only becomes money if the time goes back into work that wins or keeps customers, and only if the results stay as good.

How the work runs today, from first enquiry to repeat customer

We map the business from your customer's point of view, in four stages. Under each one are the tasks your team does today, the tools they use and the hours they estimate.

STAGE 1

Acquisition and reach

Referrals, Google and ads run by an outside agency.

Weekly reporting — 2 hrs

TOOLS: ADS ACCOUNT, SPREADSHEETS

STAGE 2

Sales and proposals

Enquiries become quotes, and quotes become orders.

Following up quotes **Start here** — 6 hrs

Building proposals — 5 hrs

TOOLS: CRM, INBOX

STAGE 3

Delivery

Orders are scheduled, delivered and invoiced.

Matching invoices — 3 hrs

TOOLS: ACCOUNTS SYSTEM, INBOX

STAGE 4

Retention and business health

Keeping customers informed and coming back.

Client updates — 1.5 hrs

TOOLS: INBOX, PHONE

WHAT THE TEAM WANTS TO HAND OVER

Chasing quotes, first drafts of proposals, matching invoices, pulling the weekly numbers together.

WHAT THE TEAM KEEPS

Gathering context, their own perspective and knowledge, and direct relationships with your customers. That work is your competitive advantage, so it stays with people.

Your team decides this list, not us. It tells us which work to automate and which to leave alone.

From the simple sum to a figure you can check

Here is everything the one-line sum leaves out, and what each item does to the total across all five automations.

The simple sum 17.5 hours a week × $65 an hour × 48 weeks. It assumes every task goes to zero.	$54,600
How much is really automated, and the human in the loop Someone still gives the AI the right context, checks what it produces and fixes what's wrong: 4.5 hours a week.	– $14,040
The build, on your side 64 hours of your team's time showing us how the work is done, testing and giving feedback.	– $4,160
What it costs to run Tokens, the tools it sits on and maintenance: about $270 a month. Token costs move around, so we'll review this.	– $3,240
What we expect in year one Before the build price, which we quote once the scope is agreed.	$33,160

Two things no sum can show

DO THE HOURS BECOME MONEY?

Hours saved are only cash saved if the time goes into work that wins or keeps customers. For each automation on the next page we name where the time should go. If it doesn't go there, the saving only exists in a spreadsheet.

IS THE RESULT AS GOOD?

A faster follow-up that wins less often loses you money. Each automation has one measure to watch, such as the share of quotes accepted, and we check it against today's figure before and after.

OUR RULE

If we can't show you how a figure was worked out, and what would make it wrong, it doesn't go in the report.

Every automation, ranked by what we expect it to return in year one

You pick what to build. We'd start at the top and work down, one at a time.

#	AUTOMATION	HOURS A WEEK NOW → AFTER	YOUR TEAM'S BUILD TIME	RUNNING A MONTH	EXPECTED IN YEAR ONE
1	**Quote follow-ups** Start here Drafts each follow-up from the quote and the customer's history. A person checks and sends it. **Time goes to** following up more quotes, sooner. **Watch** the share of quotes accepted.	6 → 1.5	12 hrs	$60	**$12,540**
2	**Building proposals** Writes the first draft from the enquiry, your price list and past jobs like it. **Time goes to** tailoring each proposal to the customer. **Watch** the share of proposals won.	5 → 1.5	20 hrs	$90	**$8,540**
3	**Invoice matching** Matches supplier invoices to orders and flags the ones that don't agree. **Time goes to** chasing the invoices that are wrong. **Watch** errors caught before payment.	3 → 0.5	16 hrs	$50	**$6,160**
4	**Weekly reporting** Pulls the week's numbers from ads, sales and accounts into one page. **Time goes to** acting on the numbers. **Watch** whether the report is used each week.	2 → 0.5	8 hrs	$30	**$3,800**
5	**Client updates** Drafts order and delivery updates for the team to check and send. **Time goes to** calls with customers who need one. **Watch** repeat orders.	1.5 → 0.5	8 hrs	$40	**$2,120**
	Total	**17.5 → 4.5**	**64 hrs**	**$270**	**$33,160**

Worked example for row 1: 4.5 hours saved a week × $65 × 48 weeks = $14,040, less 12 hours of your team's build time ($780), less 12 months of running costs ($720) = $12,540. The build price is not included in any row.

5. Before anything gets built

Is the team equipped, and can we measure it?

The cost that rarely makes it into a proposal is getting your team and your data ready for AI to work. Here's where you stand today.

IS THE TEAM EQUIPPED?

Do they have access to the right models?	Yes
Does the AI connect to your tools and data properly?	Not yet
Do they have the security access they need, without friction?	Partly
Is your information in one central place that's AI legible?	Not yet

CAN WE MEASURE IT?

How long a quote follow-up really takes	Estimated
The share of quotes accepted	Not tracked
What the team's week goes on	Estimated

So the first job is four weeks of simple reporting on quotes. Then over 12 months you can see what the automation is doing.

First build: quote follow-ups

STEP 1

Measure

Four weeks of real numbers, so there's something to compare against.

STEP 2

Scope

We agree the scope and the price before work starts.

STEP 3

Build and test

On the systems you already have, with the people who'll use it.

STEP 4

Train and review

We train the team, then check the figures against this report.

It's your call from here

BUILD IT WITH US

Pick the automations worth doing. A typical engagement ranges from $5,000 to $50,000, depending on what we're building. Afterwards there's an optional retainer to keep it all running and find new opportunities.
